Figure 8. Transporting hay to an outbuilding

249 Those islanders who dwell in thatched houses or who own other buildings which are thatched grow rye, as do a few farmers who use it as fodder. It is planted in recently dug potato fields at the same time as grass and is ready for harvesting the next August. Rye for thatching is pulled rather than cut, and compressed into [342] small bundles which are propped against fences for drying. Pulling is preferred because grass and weeds can be separated out, and the roots will furnish friction [343] to keep the bundles from slipping when they are placed on the roof later. After drying, the bundles are carried to barns or outbuildings to be flailed, winnowed, and stored until used a month or two afterward. Flailing is done by striking the tops of the bundled plants against a stone placed a foot from an indoor wall, in such a way that the seeds are separated and collected at the base of the wall. Later the grain is spread on a flagging and winnowed by allowing handfuls of seed to [246] fall to the rock surface so that wind blows away the chaff. Rye used as fodder is planted with grass and cut when "green" at the same time that hay is cut, and is handled in almost the same way as the latter.

Care of Livestock

175 The export of fish, kelp, pigs, cattle, and sheep accounted for 90 percent 434 of the income of Inis Beag folk in 1893, as reported by the Congested Districts 437 Board. The sale of cattle and sheep ranked last, for at that time indigenous soils [311] were not adequate either in extent or grass yield to support many livestock, and 178 fields on the terraces were used mostly for farming. But over the past 70 years

Inis Beag

Celts. But local legend, historical evidence, and genealogical data collected by my wife and me indicate that the present population is descended from immigrants who came to the island from many parts of Ireland following the Cromwellian incursion of the seventeenth century. The islanders still express bitterness over conditions of poverty and servitude experienced by their ancestors during the 300 years that they lived under absentee Anglo-Irish landlords. All of the excesses of foreign domination suffered by mainland peasants were suffered by the inhabitants of Inis Beag, but were aggravated by the ordinary hardships of island living. Little was known about events in Inis Beag during the eighteenth and early nineteenth centuries until the island was visited by archeologists and publicized in their scientific writings. The surrounding area of the mainland was very much isolated and seldom visited at that time, although trading between Inis Beag and nearby communities was carried on, and passing ships sometimes called at the island.

Agricultural pursuits have always dominated the subsistence economy of Inis Beag. Most householders own land on which they grow potatoes and other vegetables, grass, and sometimes rye and sally rods and where they pasture cattle, sheep, goats, asses, and horses. The back of the island, behind the communities, is divided into four strips, and each landowner possesses numerous plots located along the "quarter" on which his village fronts. The average combined holding is sixteen acres, and almost 50 percent of the land is composed of arable indigenous and manufactured soils. Potatoes are the staple crop, and they are supplemented by various other vegetables, milk from cattle and goats, meat from island sheep, fish, eggs, and other foods, many of which are imported and sold in the shops. Rye is grown for thatching, and sally rods are used to weave several types of containers. Other subsistence activities (which also provide income for some folk) are knitting, weaving, crocheting, tailoring, and sandal making.

A slowly expanding cash economy features the export of cattle and sheep fattened on the island and of surplus potatoes and fish, the collection of seaweed for extraction of iodine at a mainland factory, the keeping of tourists in private homes, and the manufacturing of craft objects for sale to visitors and for export. At the turn of the century, fishing from canoes—with nets and lines often many miles out in the ocean—was an important subsistence and income activity. A few islanders who owned little or no land lived primarily by fishing and kelp-making. But over the past few decades, fish have become less plentiful and the weather more inclement, especially during winter
